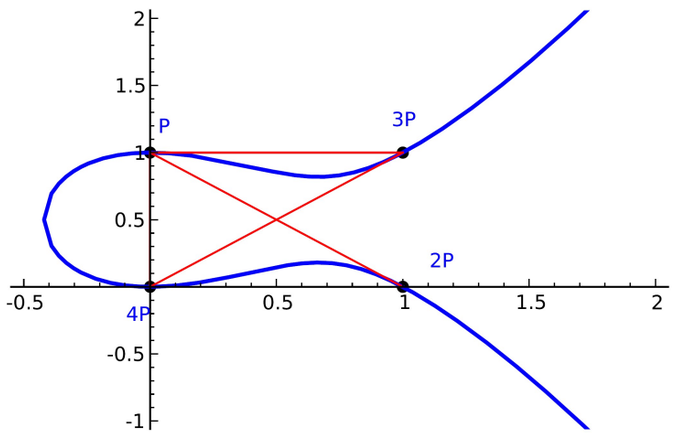
IMBM, May 21st, 2021.

"Towards a classification of adelic Galois representations attached to elliptic curves over $\mathbb{Q}$"

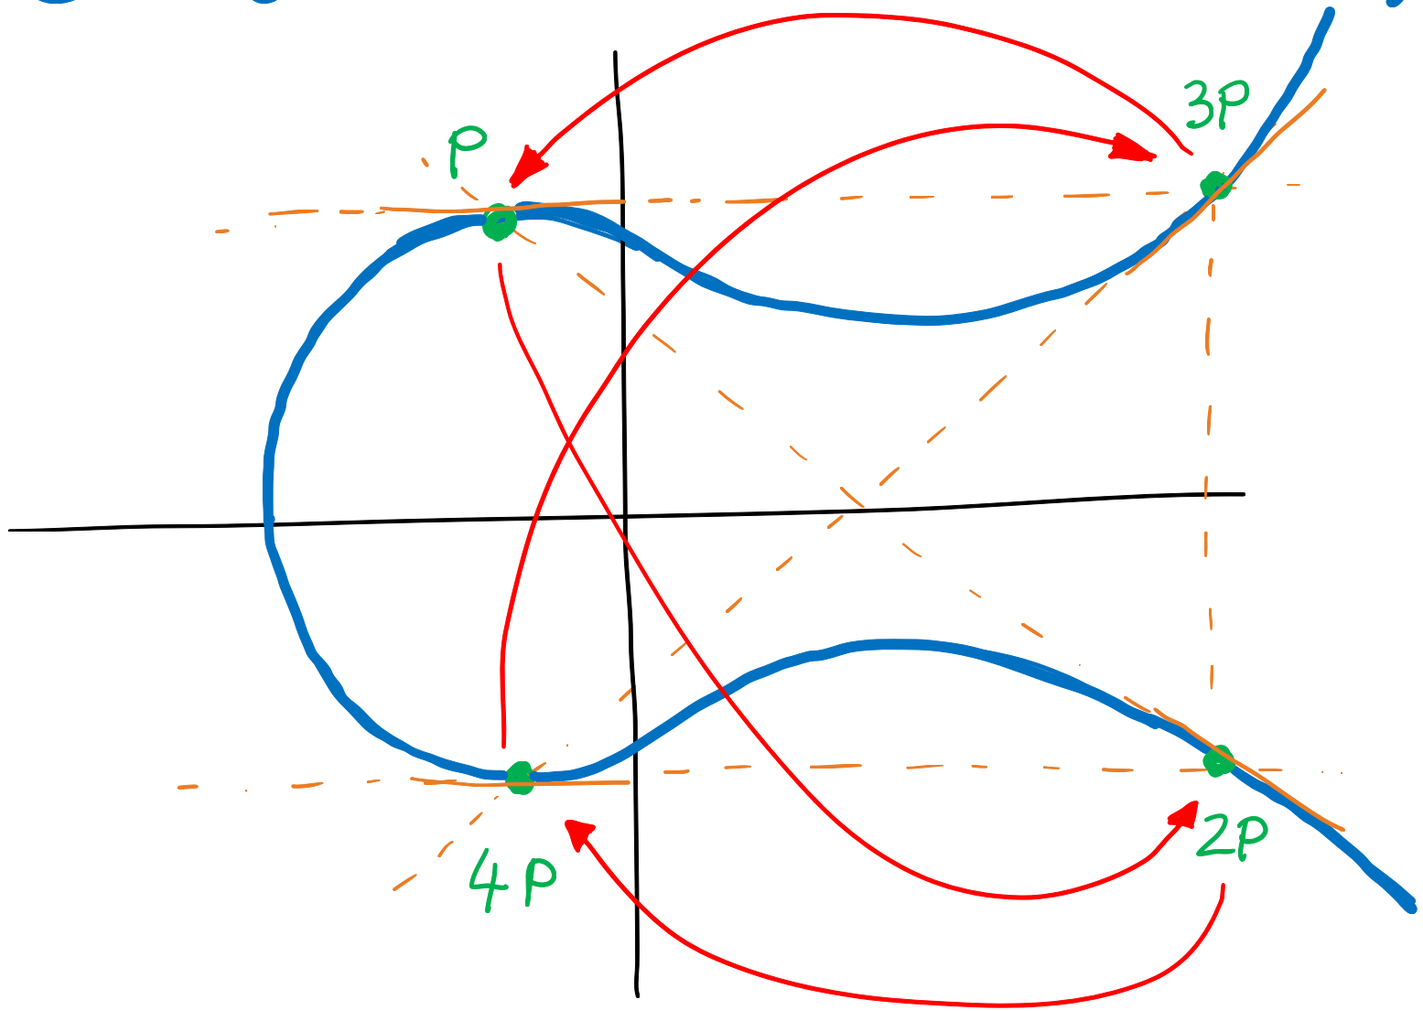


Alvaro Lozano-Robledo
University of Connecticut.

$E/\mathbb{Q}$ an elliptic curve.

$$\rho_E : Gal(\bar{\mathbb{Q}}/\mathbb{Q}) \longrightarrow GL(2, \hat{\mathbb{Z}})$$

example:
the Galois action
on a point of order 5.



Let $E/\mathbb{Q}$ be an elliptic curve.

Thm. (Mordell-Weil) $E(\mathbb{Q})$ is a finitely generated abelian group.

- $E(\overline{\mathbb{Q}})$ is NOT finitely generated but its torsion subgroup is well-understood!

$$E(\overline{\mathbb{Q}})_{tors} = \bigcup_{n \geq 2} E[n]$$

and $E[n] = E(\overline{\mathbb{Q}})[n] \cong \mathbb{Z}/n\mathbb{Z} \oplus \mathbb{Z}/n\mathbb{Z}$.

$E(\overline{\mathbb{Q}})[n]$: n-torsion subgroup

$\mathrm{Gal}(\overline{\mathbb{Q}}/\mathbb{Q}) = G_{\mathbb{Q}}$

$E(\bar{\mathbb{Q}})[n] \cong \mathbb{Z}/n\mathbb{Z} \oplus \mathbb{Z}/n\mathbb{Z}$ ↻ $\mathrm{Gal}(\bar{\mathbb{Q}}/\mathbb{Q})$ … fixed points?

$= G_{\mathbb{Q}}$

- Over $\mathbb{Q}$:

Thm. (Mazur) $E(\mathbb{Q})_{tors} \cong \begin{cases} \mathbb{Z}/N\mathbb{Z} & N = 1, 2, \ldots, 10, \text{ or } 12, \text{ or} \\ \mathbb{Z}/2\mathbb{Z} \oplus \mathbb{Z}/2M\mathbb{Z} & M = 1, 2, 3, \text{ or } 4. \end{cases}$

(and ∞'ly many j's for each possibility!)

- How about (cyclic) $G_{\mathbb{Q}}$-invariant subgroups? (not just pointwise-fixed)

Thm. (Fricke, Kenku, Klein, Kubert, Ligozat, Mazur, Ogg, …)

If $\langle P \rangle \subseteq E(\bar{\mathbb{Q}})$ is finite, $G_{\mathbb{Q}}$-invariant, then

$\langle P \rangle \cong \mathbb{Z}/N\mathbb{Z}$ w/ $\begin{cases} N = 1, \ldots, 10, \text{ or } 12, 13, 16, 18, 25 & (\infty\text{'ly many } j\text{'s for each possibility}) \\ \text{or} & j = -2^{15} \cdot 3 \cdot 5^3 \\ N = 11, 14, 15, 17, 19, 21, 27, 37, 43, 67, \text{or } 163 & (\text{only } < \infty \ j\text{'s}) \end{cases}$

NOTE: $\{ \langle P \rangle \subset G_{\mathbb{Q}} \} \longleftrightarrow \left\{ \begin{array}{c} \text{isogenies} \\ E \to E'/\mathbb{Q} \\ \text{w/ cyclic kernel} \end{array} \right\}$

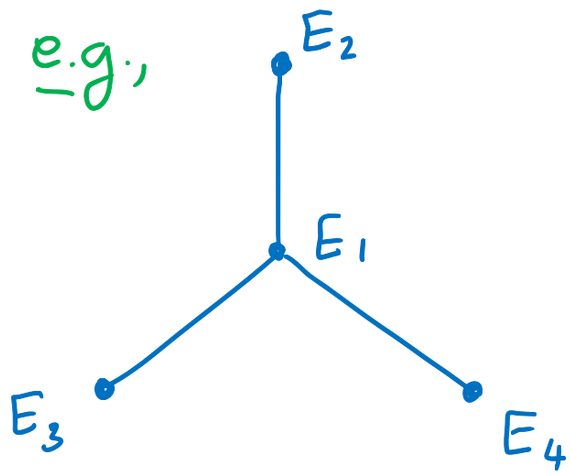
- Combine previous two results... $E_{/\mathbb{Q}} \longrightarrow E'_{/\mathbb{Q}}$ an isogeny.

Q. What are the possible combinations for the pair

$$\left(E(\mathbb{Q})_{tors} , E'(\mathbb{Q})_{tors} \right) ?$$

More generally... consider the entire $\mathbb{Q}$-isogeny class of E.

e.g.,

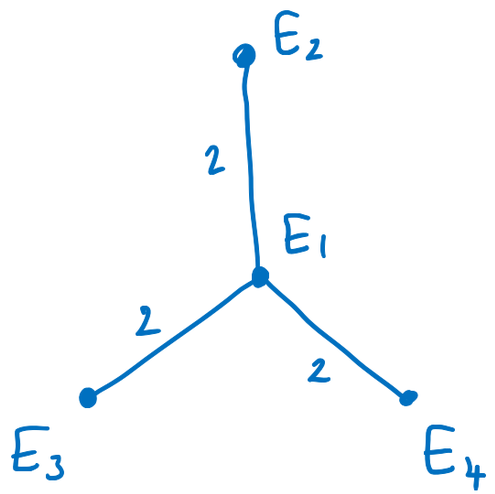


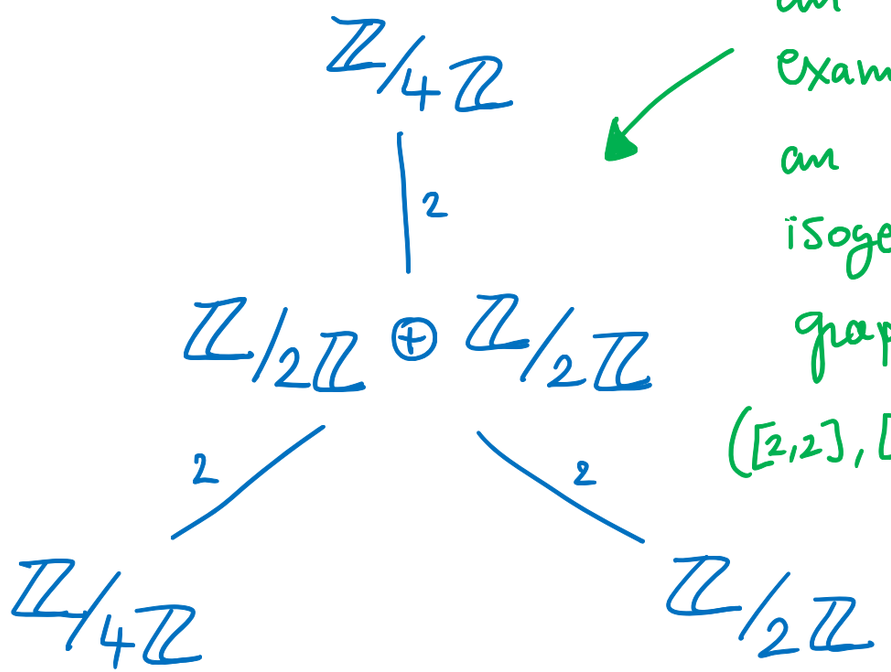
What are the possibilities for

$$\left(E_i(\mathbb{Q})_{tors} \right)_{i=1}^{4} ?$$

Example $E = E_1 : y^2 + xy + y = x^3 - x^2 - 6x - 4$

(17.a2)



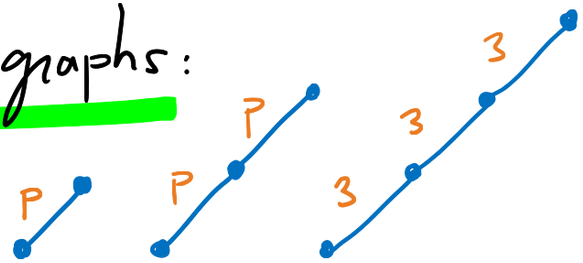


an example of an isogeny-torsion graph, of type $([2,2],[4],[4],[2])$

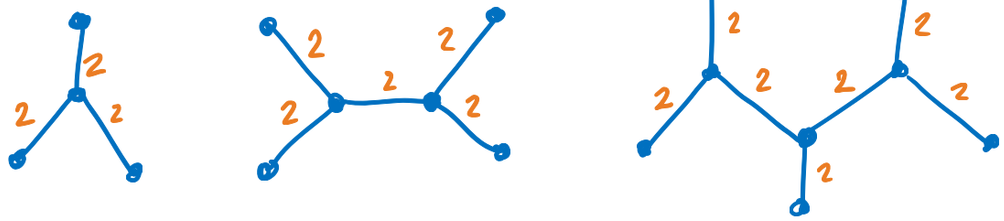
Thm. (Chiloyan, L-R.)
There are 52 iso. types of isogeny-torsion graphs attached to isogeny classes over $\mathbb{Q}$.

Types of isogeny graphs:

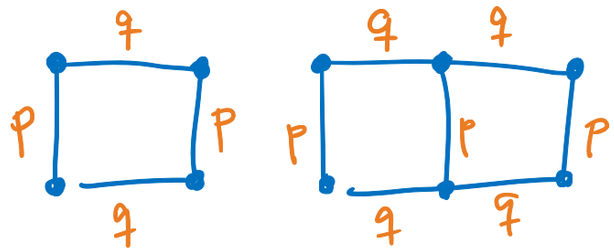
- Linear:



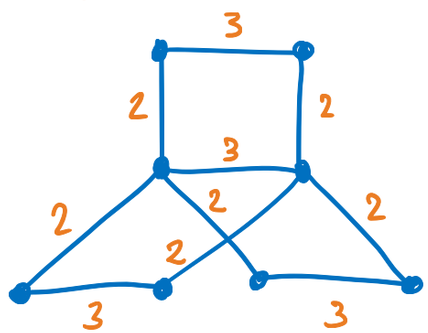
- T_k-graphs:



- Rectangular:



- S graphs:



Graph Type	Label	Isomorphism Types	LMFDB Label
	T_4	([2,2], [2], [2], [2])	120.a
		([2,2], [4], [2], [2])	33.a
		([2,2], [4], [4], [2])	17.a
	T_6	([2,4],[4],[4],[2,2],[2],[2])	24.a
		([2,4],[8],[4],[2,2],[2],[2])	21.a
		([2,2],[2],[2],[2,2],[2],[2])	126.a
		([2,2],[4],[2],[2,2],[2],[2])	63.a
	T_8	([2,8],[8],[8],[2,4],[4],[2,2],[2],[2])	210.e
		([2,4],[4],[4],[2,4],[4],[2,2],[2],[2])	195.a
		([2,4],[4],[4],[2,4],[8],[2,2],[2],[2])	15.a
		([2,4],[8],[4],[2,4],[4],[2,2],[2],[2])	1230.f
		([2,2],[2],[2],[2,2],[2],[2,2],[2],[2])	45.a
		([2,2],[4],[2],[2,2],[2],[2,2],[2],[2])	75.b

TABLE 2. The list of all T_k rational isogeny-torsion graphs

What do these results (Mazur/$\mathbb{Q}$, isogenies/$\mathbb{Q}$, isogeny-torsion/$\mathbb{Q}$, ...) have in common?

All this information is captured by the (adelic) Galois representation of E.

$$E[n] \circlearrowleft G_{\mathbb{Q}} \rightsquigarrow \rho_{E,n} : G_{\mathbb{Q}} \to \mathrm{Aut}(E[n])$$

$$E[n] \cong \mathbb{Z}/n\mathbb{Z} \oplus \mathbb{Z}/n\mathbb{Z}$$

$$\mathrm{Aut}(E[n]) \cong GL(2, \mathbb{Z}/n\mathbb{Z})$$

ex (of Mazur's theorem)

$$E(\mathbb{Q})_{tors} \cong \mathbb{Z}/8\mathbb{Z} \oplus \mathbb{Z}/2\mathbb{Z}$$

$$E[8] = \langle P, Q \rangle$$

s.t. $4Q \in E(\mathbb{Q})$, and $P \in E(\mathbb{Q})$.

$$\rho_{E,8} : G_{\mathbb{Q}} \longrightarrow \left\{ \begin{pmatrix} 1 & 2b \\ 0 & c \end{pmatrix} : \begin{array}{l} c \equiv 1 \bmod 2 \\ b, c \in \mathbb{Z}/8\mathbb{Z} \end{array} \right\}$$

$$\subseteq GL(2, \mathbb{Z}/8\mathbb{Z})$$

ex (of isogenies/$\mathbb{Q}$)

$E/\mathbb{Q}$, $\langle P \rangle \subseteq E(\overline{\mathbb{Q}})$ of order 163, $E[163] = \langle P, Q \rangle$

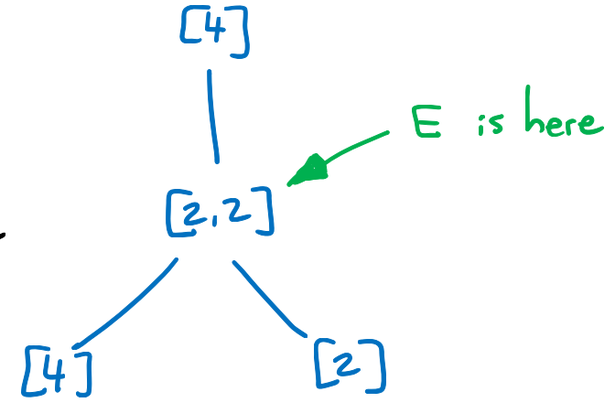
$G_{\mathbb{Q}}$ acts on $\langle P \rangle$

$$\rho_{E,163} : G_{\mathbb{Q}} \longrightarrow \left\{ \begin{pmatrix} a & b \\ 0 & c \end{pmatrix} : \begin{array}{l} a,b,c \in \mathbb{Z}/163\mathbb{Z} \\ a,c \neq 0 \bmod 163 \end{array} \right\}$$

$$\subseteq GL(2, \mathbb{Z}/163\mathbb{Z})$$

ex (of isogeny-torsion graphs)

$E/\mathbb{Q}$ with a T_4-isogeny-torsion graph



$$\rho_{E,4} : G_{\mathbb{Q}} \longrightarrow \left\{ \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}, \begin{pmatrix} 1 & 2 \\ 0 & 1 \end{pmatrix}, \begin{pmatrix} 1 & 0 \\ 2 & 3 \end{pmatrix}, \begin{pmatrix} 1 & 2 \\ 2 & 3 \end{pmatrix} \right\}$$

$$\subseteq GL(2, \mathbb{Z}/4\mathbb{Z})$$

Put all $\rho_{E,n}$ together!

$$T(E) = \varprojlim E[n] \cong \varprojlim \mathbb{Z}/n\mathbb{Z} \oplus \mathbb{Z}/n\mathbb{Z}$$

$$= \hat{\mathbb{Z}} \oplus \hat{\mathbb{Z}}$$

$G_{\mathbb{Q}}$ acts on $T(E)$

$$\rightsquigarrow \rho_E : G_{\mathbb{Q}} \longrightarrow \mathrm{Aut}(T(E)) \cong GL(2, \hat{\mathbb{Z}})$$

Q: What are the possible images of $\rho_E \subseteq GL(2, \hat{\mathbb{Z}})$?
(up to conjugation!)

Mazur's "Program B"

(from "Rational points on modular curves." in Modular Functions of One Variable V.)

B. Given a number field K and a subgroup H of $GL_2\hat{\mathbb{Z}} = \prod_p GL_2\mathbb{Z}_p$ classify all elliptic curves $E_{/K}$ whose associated Galois representation on torsion points maps $\mathrm{Gal}(\bar{K}/K)$ into $H \subset GL_2\hat{\mathbb{Z}}$.

Thm. (Serre) If $E/\mathbb{Q}$ does not have CM, then

$\operatorname{Im} \rho_E$ is open (finite index) in $GL(2, \hat{\mathbb{Z}})$.

Moreover, $[GL(2, \hat{\mathbb{Z}}) : \operatorname{Im} \rho_E] \geq 2$. (index is in fact even!)

Serre's Question. If $E/\mathbb{Q}$ does not have CM,

is $\rho_E \bmod p \twoheadrightarrow GL(2, \mathbb{F}_p)$ for all $p > 37$?

Conjecture. (Zywina) If $E/\mathbb{Q}$ does not have CM, then except for a finite number of exceptions ($j \in J$, w/ J finite):

$$[GL(2, \hat{\mathbb{Z}}) : \operatorname{Im} \rho_E] \in \left\{ \begin{array}{l} 2, 4, 6, 8, 10, 12, 16, 20, 24, 30, 32, 36, 40, 48, 54, 60, \\ 72, 84, 96, 108, 112, 120, 144, 192, 220, 240, 288, \\ 336, 360, 384, 504, 576, 768, 864, 1152, 1200, 1296, 1536 \end{array} \right\}$$

The CM case

$E/\mathbb{Q}(j_{K,f})$ w/ $j(E) = j_{K,f}$

Thm. (L-R.) Let $j_{K,f}$ be a CM j-invariant w/ CM by $\mathcal{O}_{K,f} \subseteq K$, and

- if $\Delta_K \cdot f^2 \equiv 0 \bmod 4$, let $\delta = \Delta_K f^2/4$, $\phi = 0$,
- if $\Delta_K \cdot f^2 \equiv 1 \bmod 4$, let $\delta = (\Delta_K - 1) f^2/4$, $\phi = f$.

For $N \geq 2$, define $C_{\delta,\phi}(N) = \left\{ \begin{pmatrix} a+b\phi & b \\ \delta b & a \end{pmatrix} : \begin{array}{l} a, b \in \mathbb{Z}/N\mathbb{Z} \\ a^2 + ab\phi - \delta b^2 \in (\mathbb{Z}/N\mathbb{Z})^\times \end{array} \right\}$

and $N_{\delta,\phi}(N) = \left\langle C_{\delta,\phi}(N), \begin{pmatrix} -1 & 0 \\ \phi & 1 \end{pmatrix} \right\rangle$,

and $N_{\delta,\phi} = \varprojlim N_{\delta,\phi}(N)$.

Then, $\mathrm{Im}\,\rho_E \subseteq N_{\delta,\phi}$ and $d_E = [N_{\delta,\phi} : \mathrm{Im}\,\rho_E]$

divides $\mathcal{O}_{K,f}^\times$ (so it divides 4 or 6, and divides 2 if $j \neq 0, 1728$).

See also Bourdon + Clark's work on CM!

The 2-adic case

Thm. (Rouse, Zureick-Brown)

Let $E/\mathbb{Q}$ be an elliptic curve w/o CM. Then, the image of

$$\rho_{E,2^\infty} : G_{\mathbb{Q}} \longrightarrow \mathrm{Aut}(T_2(E)) \cong GL(2, \mathbb{Z}_2)$$

is one of 1208 possibilities (up to conjugation).

Moreover, the index $[GL(2,\mathbb{Z}_2) : \mathrm{Im}\,\rho_{E,2^\infty}]$ divides 64 or 96,

and $\rho_{E,2}$ is defined modulo 32.

(Whoa!)

The largest possible adelic image

An elliptic curve $E/\mathbb{Q}$ w/ $[GL(2,\hat{\mathbb{Z}}) : \mathrm{Im}\,\rho_E] = 2$ is called a Serre curve.

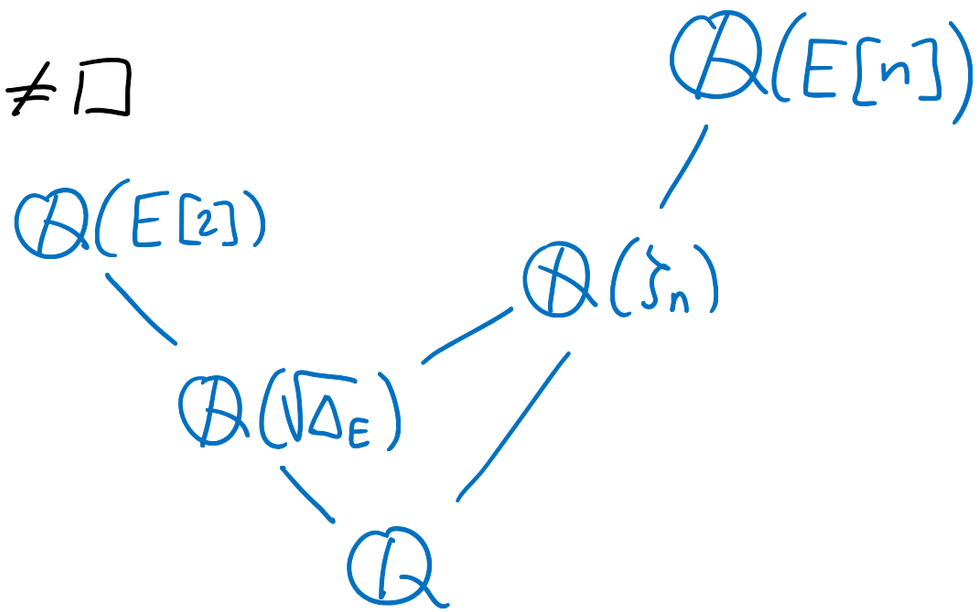
- Cojocaru, Grant, Jones: "almost all" curves are Serre curves (except 'thin' sets)
- Daniels: explicit infinite family of Serre curves.

Why is $[GL(2,\hat{\mathbb{Z}}) : \mathrm{Im}\,\rho_E]$ even?

- Either $\Delta_E = \square \Rightarrow \mathrm{Gal}(\mathbb{Q}(E[2])/\mathbb{Q}) \cong \{0\}$ or $\mathbb{Z}/3\mathbb{Z}$

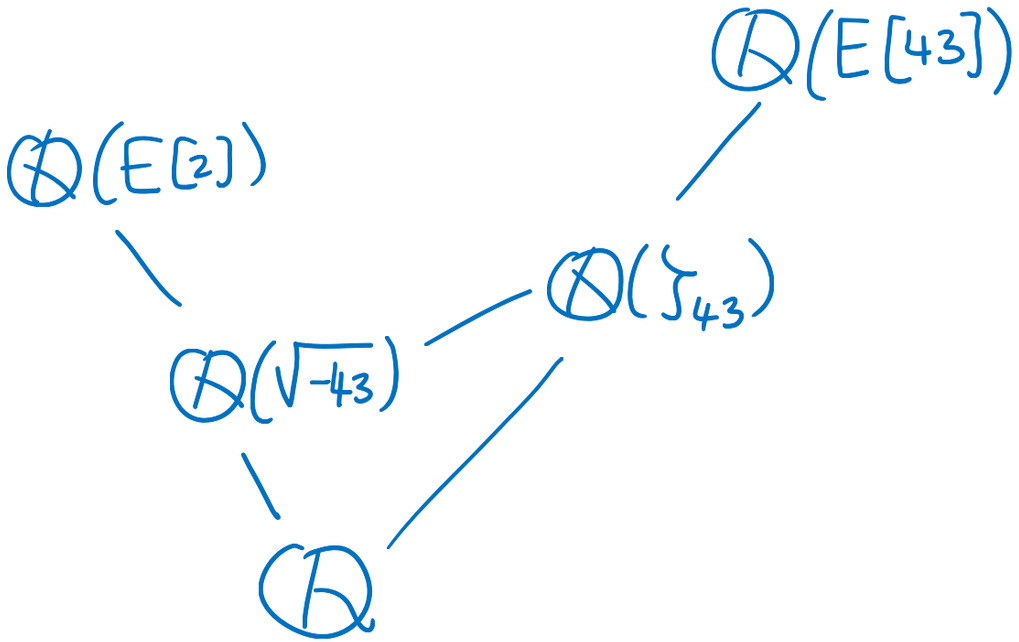
  $\Rightarrow [GL(2,\mathbb{Z}_2) : \mathrm{Im}\,\rho_{E,2^\infty}]$ is even.

- Or $\Delta_E \neq \square$



$\rightsquigarrow$ "Galois entanglement" between $\mathbb{Q}(E[2])$ and $\mathbb{Q}(E[n])$.

example $E: y^2+y = x^3+x^2$, $\Delta_E = -43$



In this case:

- $\rho_{E,2^\infty}: G_{\mathbb{Q}} \longrightarrow GL(2,\mathbb{Z}_2)$

and

- $\rho_{E,43^\infty}: G_{\mathbb{Q}} \longrightarrow GL(2,\mathbb{Z}_{43})$

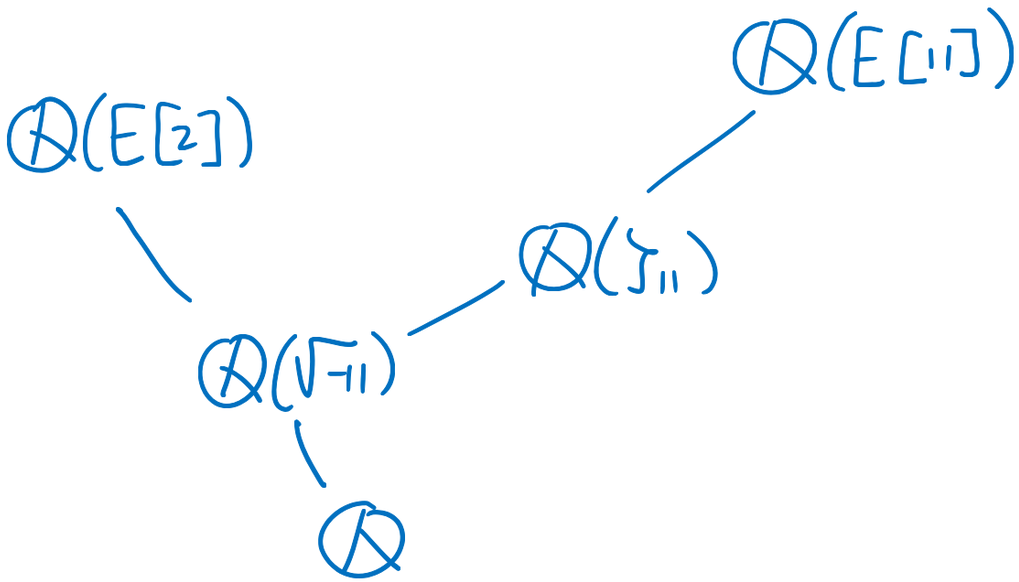
are surjective.

But ρ_E is NOT surjective b/c $\rho_{E,86}: G_{\mathbb{Q}} \longrightarrow GL(2,\mathbb{Z}/86\mathbb{Z})$ is not surjective (image is index 2).

(However, here $[GL(2,\hat{\mathbb{Z}}) : \mathrm{Im}\,\rho_E] = 2$.)

↑ Serre!

example $E: y^2+y = x^3-x^2$, $\Delta_E = -11$.



Here $\rho_{E,2^\infty}$ and $\rho_{E,11^\infty}$ are surjective BUT entangled ($\rho_{E,22}$).

AND $E(\mathbb{Q})_{tors} \cong \mathbb{Z}/5\mathbb{Z} \longrightarrow \rho_{E,5}: G_{\mathbb{Q}} \to \left\{\begin{pmatrix} 1 & * \\ 0 & * \end{pmatrix}\right\} \subseteq GL(2,\mathbb{F}_5)$ index 24.

$$\Longrightarrow \left[GL(2,\hat{\mathbb{Z}}) : \mathrm{Im}\,\rho_E\right] \geq 48.$$

But wait! There is more!

Example $E: y^2+y = x^3 - x^2$, $\Delta_E = -11$.

- Here $\rho_{E,2^\infty}$ and $\rho_{E,11^\infty}$ are surjective but entangled ($\rho_{E,22}$).
- $E(\mathbb{Q})[5] \cong \mathbb{Z}/5\mathbb{Z} \Rightarrow \rho_{E,5}: G_{\mathbb{Q}} \longrightarrow \left\{\begin{pmatrix} 1 & * \\ 0 & * \end{pmatrix}\right\} \subseteq GL(2, \mathbb{Z}/5\mathbb{Z})$
- E has a $\mathbb{Q}$-isogeny of degree 25! (to $y^2+y = x^3-x^2-7820x-263580$)

$$\Rightarrow \rho_{E,25}: G_{\mathbb{Q}} \longrightarrow \left\{\begin{pmatrix} * & * \\ 0 & * \end{pmatrix}\right\} \subseteq GL(2, \mathbb{Z}/25\mathbb{Z})$$

($*$: $\equiv 1 \bmod 5$; the subgroup has index 120)

$$\Rightarrow \left[GL(2, \hat{\mathbb{Z}}) : \operatorname{Im} \rho_E\right] \geq 240 \text{ !!}$$

(ex. If $j(E) = -7 \cdot 11^3$, then index ≥ 2736.)

How bad can entanglements be? (joint with Harris Daniels)

Q When is $\mathbb{Q}(E[n]) = \mathbb{Q}(E[m])$?

ex $E: y^2 = x^3 + 405x - 9882$

then $\mathbb{Q}(E[2]) = \mathbb{Q}(E[3]) = \mathbb{Q}(E[6]) = \mathbb{Q}(\zeta_3, \sqrt[3]{3})$

ex $E: y^2 = x^3 + 13x - 34$

then $\mathbb{Q}(E[2]) = \mathbb{Q}(E[4]) = \mathbb{Q}(i)$.

(VERTICAL)

Thm. (Daniels, L-R.)

(1) If $\mathbb{Q}(E[p^n]) = \mathbb{Q}(E[p^{n+1}])$

then $p=2$, $n=1$ (and explict param. of all examples).

(2) If $\mathbb{Q}(E[p^n]) \cap \mathbb{Q}(\zeta_{p^{n+1}}) = \mathbb{Q}(\zeta_{p^{n+1}})$

then $p=2$.

ex $E: y^2 = x^3 - 11x - 14$

then $\mathbb{Q}(\zeta_{2^{n+1}}) \subseteq \mathbb{Q}(E[2^n])$ for all $n>1$.

(HORIZONTAL)

Thm. (Daniels, L-R.)

(1) If $\mathbb{Q}(E[p^n]) = \mathbb{Q}(E[q^m])$, and $p \neq q$ are primes, then $p^n = 2$, $q^m = 3$ (plus param.)

(2) If $\mathbb{Q}(E[n]) = \mathbb{Q}(E[m])$ is abelian, $n \geq m \geq 2$,

(a) Either $m = 2$, $n = 4$, and $\mathbb{Q}(E[2]) = \mathbb{Q}(E[4]) = \mathbb{Q}(i)$,

(b) Or $m = 3$, $n = 6$, with

$$\mathbb{Q}(E[2]) \subsetneq \mathbb{Q}(E[3]) = \mathbb{Q}(E[6]).$$

What types of entanglements are there?

(joint w/ Harris Daniels and Jackson Morrow)

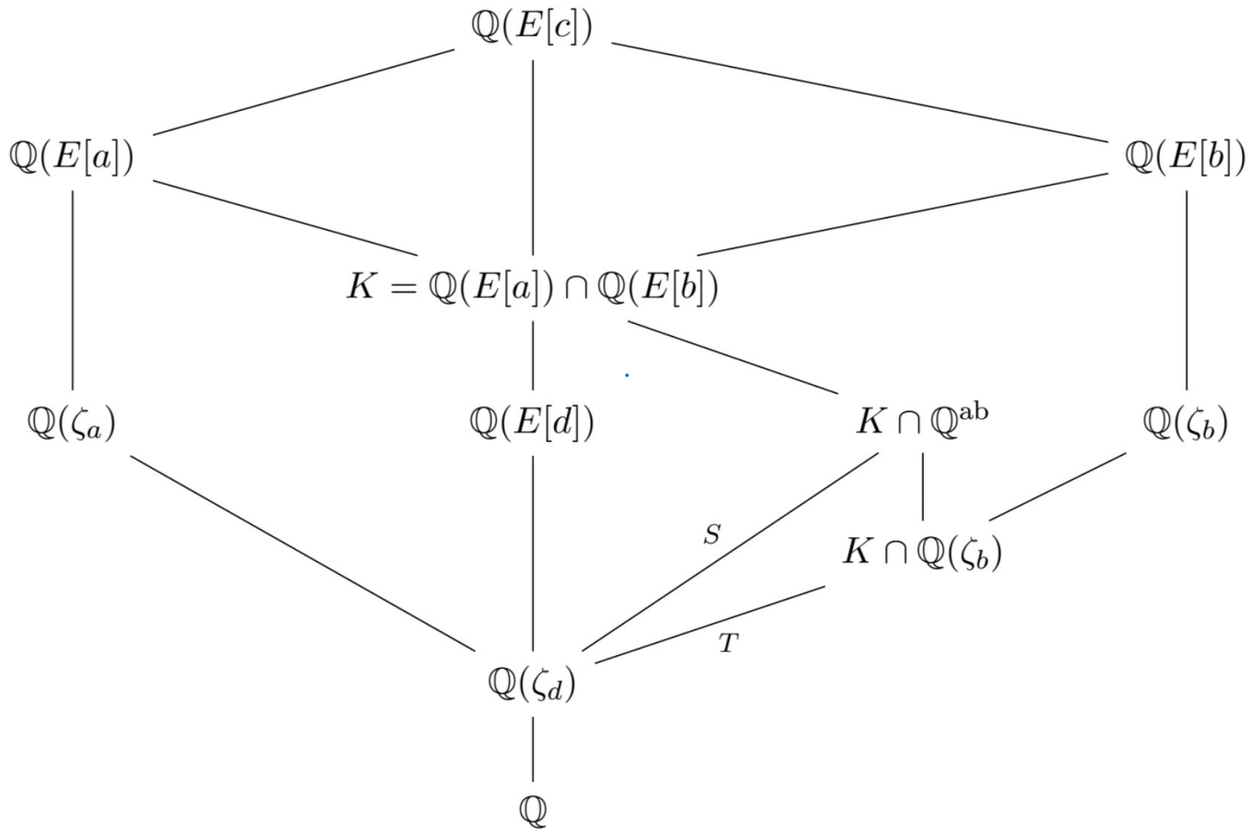


FIGURE 3.1. An abelian (a, b)-entanglement of type S, and a Weil (a, b)-entanglement of type T, where $c = \mathrm{lcm}(a, b)$ and $d = \gcd(a, b)$.

Types of abelian entanglements:

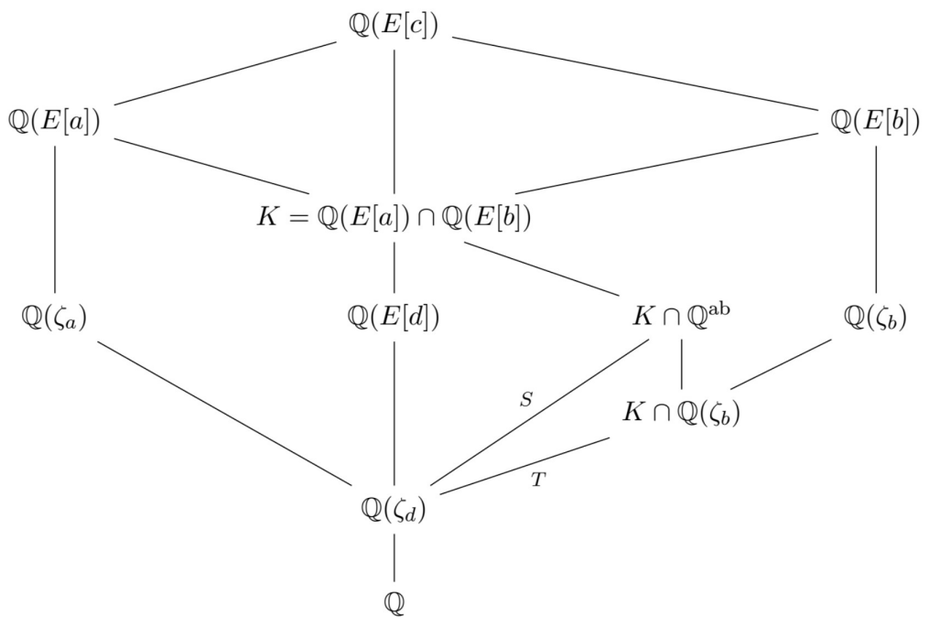

FIGURE 3.1. An abelian (a, b)-entanglement of type S, and a Weil (a, b)-entanglement of type T, where $c = \mathrm{lcm}(a, b)$ and $d = \gcd(a, b)$.

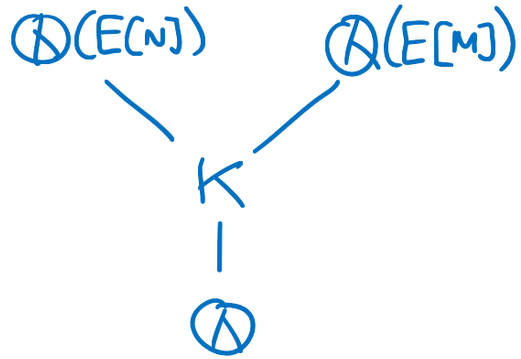
- Serre entanglements
  - ↳ either $\rho_{E,2^\infty}$ is not surjective
  - ↳ or $\mathbb{Q}(\sqrt{\Delta_E}) \subseteq \mathbb{Q}(E[2]) \cap \mathbb{Q}(\zeta_n)$
- CM entanglements

  $E/\mathbb{Q}$ w/ CM by K

  for $N, M \geq 3$.



- Weil entanglements (see diagram)

example Let d be sq. free integer, $t \neq 1$, $t \in \mathbb{Q}$.

Let $E_t^d : dy^2 = x^3 - 27t(t^3+8)x + 54(t^6 - 20t^3 - 8)$

then

$$\operatorname{Im} \rho_{E_t^d, 3} = \left\{ \begin{pmatrix} * & 0 \\ 0 & * \end{pmatrix} \right\}$$

s.t. $\mathbb{Q}(E_t^d[3]) = \mathbb{Q}(\sqrt{-3}, \sqrt{d})$.

If n is minimal s.t. $\mathbb{Q}(\sqrt{d}) \subseteq \mathbb{Q}(J_n)$

then $\mathbb{Q}(\sqrt{d}) = \mathbb{Q}(E[3]) \cap \mathbb{Q}(E[n])$ which results in an entanglement.

(a $(3,n)$- Weil entanglement of type $\mathbb{Z}/2\mathbb{Z}$)

Abelian (p,q)-entanglements

$$\mathrm{Gal}(\overline{\mathbb{Q}}/\mathbb{Q}) \xrightarrow{\rho_{E,p}} \mathrm{Im}\,\rho_{E,p} \subseteq \mathrm{Aut}(E[p]) \subseteq GL(2,\mathbb{F}_p)$$

$$\mathrm{Gal}(\overline{\mathbb{Q}}/\mathbb{Q}) \xrightarrow{\rho_{E,q}} \mathrm{Im}\,\rho_{E,q} \subseteq \mathrm{Aut}(E[q]) \subseteq GL(2,\mathbb{F}_q)$$

Want: $F = \left(\mathbb{Q}(E[p]) \cap \mathbb{Q}(E[q])\right) \cap \mathbb{Q}^{ab}$

Thm (Daniels, L-R.)

$E/\mathbb{Q}$ ell curve, $p>2$ prime.

$$\mathbb{Q}(E[p]) \cap \mathbb{Q}^{ab} = \begin{cases} \mathbb{Q}(\zeta_p) & \text{if } \mathrm{Im}\,\rho_{E,p} \text{ is } \begin{cases} \text{full/surjective} \\ \text{exceptional} \end{cases} \\ \mathbb{Q}(\zeta_p)\cdot K \text{ w/ } [K:\mathbb{Q}]=2 & \text{if } \mathrm{Im}\,\rho_{E,p} \text{ is } \begin{cases} \text{norm. split} \\ \text{norm non-split} \end{cases} \\ \mathbb{Q}(\zeta_p)\cdot K \text{ w/ } [K:\mathbb{Q}] \mid (p-1) & \text{if } \mathrm{Im}\,\rho_{E,p} \text{ is Borel} \end{cases}$$

Example E "1922.c2"

one of an infinite family!

- $\mathrm{Im}\,\rho_{E,2} \subseteq GL(2,\mathbb{F}_2)$

$\mathbb{Q}(E[2])$ = cyclic cubic, $\mathrm{disc} = 31^2$

- $\mathrm{Im}\,\rho_{E,7} \subseteq GL(2,\mathbb{F}_7)$

Borel $\left\{\begin{pmatrix} * & * \\ 0 & * \end{pmatrix}\right\}$ cyclic sextic, $\mathrm{disc} = -31^5$ — cuts out a

$$F = \left(\mathbb{Q}(E[2]) \cap \mathbb{Q}(E[7])\right) \cap \mathbb{Q}^{ab} = \mathbb{Q}(E[2]) \text{ is cyclic cubic, } \mathrm{disc} = 31^2.$$

- E is not CM
- Entanglement is not quadratic $\Rightarrow$ not Serre.
- Entanglement field $F \not\subseteq \mathbb{Q}(\zeta_2)$ and $\not\subseteq \mathbb{Q}(\zeta_7)$ $\Rightarrow$ not Weil

example

Let $d \neq -2, -3, 5$ be square-free, and let E^d be a twist of

$$E: y^2 + xy + y = x^3 - 126x - 552$$

Here $\mathbb{Q}(E^d[p]) \cap \mathbb{Q}^{ab} = \mathbb{Q}(J_p, \sqrt{d})$ for $p = 3, 5$.

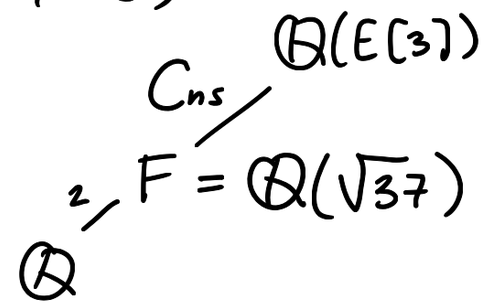
Thus, $\mathbb{Q}(E^d[3]) \cap \mathbb{Q}(E^d[5]) = \mathbb{Q}(\sqrt{d})$.

- E is NOT CM $\rightarrow$ ext. is NOT of CM type.
- ext. b/w 3- and 5-division fields $\Rightarrow$ NOT of Serre type.
- $\mathbb{Q}(\sqrt{d}) \not\subseteq \mathbb{Q}(J_3), \mathbb{Q}(J_5) \Rightarrow$ NOT of Weil type.

example

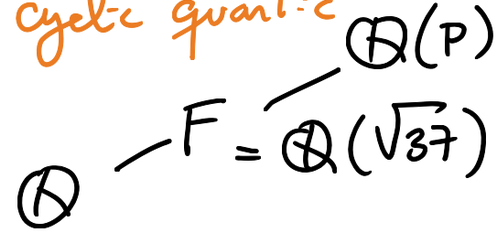
E "1369.f2"

- $\underbrace{\mathrm{Im}\,\rho_{E,3}}_{\text{Normalizer of a non-split Cartan}} \subseteq GL(2,\mathbb{F}_3)$



- $\underbrace{\mathrm{Im}\,\rho_{E,5}}_{\text{Borel}} \subseteq GL(2,\mathbb{F}_5)$

$\left\{\begin{pmatrix} * & * \\ 0 & * \end{pmatrix}\right\}$ ← cyclic quartic



$$F=\left(\mathbb{Q}(E[3])\cap\mathbb{Q}(E[5])\right)\cap\mathbb{Q}^{ab}=\mathbb{Q}(\sqrt{37})$$

- Non-CM
- Non-Serre
- Non-Weil

DANIELS, L-R., MORROW :

Theorem A. *Let $E/\mathbb{Q}$ be an elliptic curve, and let p and q be distinct primes such that E has an abelian (p,q)-entanglement of type S (Definition 3.2), for some finite abelian group S. Then, there is a finite set $J \subseteq \mathbb{Q}$, that does not depend on p, q, or S, such that if $j(E) \notin J$ and the entanglement is not of Weil, Serre, or CM type, then either $S = \mathbb{Z}/3\mathbb{Z}$ and $(p,q) = (2,7)$ or $S = \mathbb{Z}/2\mathbb{Z}$ and $(p,q) = (3,5)$.*

DANIELS, L-R., MORROW:

In the case that $S = \mathbb{Z}/3\mathbb{Z}$ and $(p, q) = (2, 7)$, $j(E)$ belongs to one of the following three explicit one-parameter families of j-invariants (which appear in Section 8.1 of [DM20]*):*

$$j_1(t) := \frac{(t^2+t+1)^3(t^6+5t^5+12t^4+9t^3+2t^2+t+1)P_1(t)^3}{t^{14}(t+1)^{14}(t^3+2t^2-t-1)^2}$$

$$j_2(t) := \frac{7^4(t^2+t+1)^3(9t^6+39t^5+64t^4+23t^3+4t^2+15t+9)P_2(t)^3}{(t^3+t^2-2t-1)^{14}(t^3+8t^2+5t-1)^2}$$

$$j_3(t) := \frac{(t^2-t+1)^3(t^6-5t^5+12t^4-9t^3+2t^2-t+1)P_3(t)^3}{(t-1)^2t^2(t^3-2t^2-t+1)^{14}}$$

where

$$P_1(t) = t^{12}+8t^{11}+25t^{10}+34t^9+6t^8-30t^7-17t^6+6t^5-4t^3+3t^2+4t+1,$$
$$P_2(t) = t^{12}+18t^{11}+131t^{10}+480t^9+1032t^8+1242t^7+805t^6+306t^5+132t^4+60t^3-t^2-6t+1,$$
$$P_3(t) = t^{12}-8t^{11}+265t^{10}-1474t^9+5046t^8-10050t^7+11263t^6-7206t^5+2880t^4-956t^3+243t^2-4t+1.$$

In the case that $S = \mathbb{Z}/2\mathbb{Z}$ and $(p, q) = (3, 5)$, $j(E)$ belongs to one of the following two explicit one-parameter families of j-invariants (which appear in Section 8.1 of [DM20]*):*

$$j_4(t) := \frac{2^{12}P_4(t)^3}{(t-1)^{15}(t+1)^{15}(t^2-4t-1)^3}$$

$$j_5(t) := \frac{2^{12}P_5(t)^3}{(t-1)^{15}(t+1)^{15}(t^2-4t-1)^3}$$

where

$$P_4(t) = t^{12}-9t^{11}+39t^{10}-75t^9+75t^8-114t^7+26t^6+114t^5+75t^4+75t^3+39t^2+9t+1,$$
$$P_5(t) = 211t^{12}-189t^{11}-501t^{10}-135t^9+345t^8+966t^7+146t^6-966t^5+345t^4+135t^3-501t^2+189t+211.$$

Theorem B. *There are infinitely many $\overline{\mathbb{Q}}$-isomorphism classes of elliptic curves E over $\mathbb{Q}$ with:*

(1) a Weil $(3,n)$-entanglement of type $\mathbb{Z}/2\mathbb{Z}$ where $3 \nmid n$,
(2) a Weil $(5,n)$-entanglement of type $\mathbb{Z}/4\mathbb{Z}$ where $5 \nmid n$,
(3) a Weil $(7,n)$-entanglement of type $\mathbb{Z}/6\mathbb{Z}$ where $6 \nmid n$,
(4) a Weil (m,n)-entanglement of type $\mathbb{Z}/2\mathbb{Z}$ where $n \geqslant 3$ and $m \in \{3,4,5,6,7,9\}$.

Theorem C. *Let $E/\mathbb{Q}$ be an elliptic curve with CM by an order $\mathcal{O}_K$ in an imaginary quadratic field K with $\Delta_K \neq -4, -8$ and $j(E) \neq 0$ or with CM by an order of $\mathcal{O}_K$ where $K = \mathbb{Q}(\sqrt{-2})$. For a choice of compatible bases of $E[n]$ for each $n \geqslant 2$, the index of the image of ρ_E in $\mathcal{N}_{\delta,\phi}(\widehat{\mathbb{Z}})$ is 2.*

NOTE: Campagna and Pengo have proved a stronger result.

Theorem D. *Let $\ell > 3$ be a prime number. Suppose that $\ell - 1 = 2e$ where $e = 2g + 1$ is some odd integer. There exist infinitely many principally polarized abelian varieties $A/\mathbb{Q}$ of dimension g which have a Weil $(2,\ell)$-entanglement of type $\mathbb{Z}/e\mathbb{Z}$.*

Thank

You !
